

Fixr - A Mobile-Based Service Marketplace System

Problem Statement:

In today's fast-paced digital world, finding reliable service providers for daily tasks such as home maintenance, repairs, cleaning, and technical services remains a challenge. Customers often rely on informal methods like word-of-mouth or social media, which lack trust, transparency, and convenience.

Similarly, skilled service providers struggle to reach potential customers efficiently and lack a centralized platform to promote their services, manage bookings, and handle payments. This results in missed opportunities, poor communication, and inefficient service delivery.

To address these challenges, there is a need for a centralized digital platform that connects customers and service providers in a structured, reliable, and scalable manner.

Proposed Solution:

The proposed system, Fixr, is a mobile-based service marketplace application that enables:

- Customers to browse, book, and pay for services easily
- Service providers to create and manage their service listings and bookings
- Administrators to monitor and manage users, services, bookings, payments, and complaints

The system aims to improve service accessibility, ensure transparency in transactions, provide a secure booking and payment process, and enhance overall user experience through a modern mobile application.

By integrating features such as real-time booking management, secure payment handling, complaint management, and administrative controls, Fixr provides an efficient and scalable solution to bridge the gap between customers and service providers.
